RESET SWITCH

Backbox: 1 gang 46mm deep (MK877ZIC)

Model No. 349

This is a single gang 'biased' key switch that is used to power down/reset the system.

The system takes approximately 2 seconds to reset itself and ALL system activations are cleared from the display.

The Reset Switch is generally located near to an Alphanumeric Display Unit in an area that is central to the installation e.g. duty room, staff office, nursing office, reception etc.

To operate simply insert the key, turn it to the RIGHT, hold it there for approximately 2 seconds and then release. It is a biased switch that automatically returns to the central position as it is designed to do so.

It is recommended to ensure that a strict protocol dictates when the system is to be reset.
